

BUSINESS REQUIREMENT DOCUMENT (BRD)

Prepared By : Abhishek Chouhan

Role : Data Analyst

Project Type : Pizza Sales

Performance & Revenue

Optimization

Date : 01/02/2026

Project Title

Pizza Sales Analysis – Business Performance & Revenue Optimization Using SQL

1. Business Background :

The business operates a pizza restaurant that offers multiple pizza varieties across different categories and sizes. Orders are placed daily by customers, and each order may include multiple pizzas. The business collects transactional sales data but currently lacks structured analysis to understand sales performance, customer preferences, and revenue drivers. Management wants to leverage historical sales data to gain actionable insights that can help improve revenue, optimize product offerings, and support data-driven decision-making.

2. Business Problem

Despite having sales data available, the business does not have clear visibility into:

- Overall sales and revenue performance
- Best-selling and least-selling pizzas
- Customer preferences by pizza category and size
- Peak order times and high-revenue days
- Product contribution to total revenue

Due to the absence of analytical insights, business decisions related to pricing, promotions, inventory planning, and menu optimization are made without data-backed evidence, resulting in missed revenue and growth opportunities.

3. Business Objective :

The objective of this project is to analyze pizza sales data using SQL to:

- Measure overall sales performance and revenue trends
- Identify top-performing and underperforming pizzas
- Understand customer ordering behavior
- Analyze sales distribution across categories, sizes, and time periods
- Generate actionable insights to improve business profitability and operational efficiency

4. Scope of the Project

The scope of this project includes:

- Analyzing historical pizza sales data
- Performing data cleaning and validation
- Writing SQL queries to answer business questions
- Generating meaningful business insights
- Providing strategic business recommendations

5. Stakeholders

- Restaurant Owner
- Business Manager
- Marketing Team
- Operations & Inventory Team
- Data Analytics Team

6. Dataset Description

The project uses the following datasets:

Table Name	Description
orders	Contains order date and time information
order_details	Contains pizza quantity per order
pizzas	Contains pizza size and price
pizza_types	Contains pizza name and category

These tables are related using primary and foreign keys to enable relational analysis.

7. Key Business Questions

The analysis aims to answer the following business questions:

- What is the total revenue generated by the business?
- How many total orders have been placed?
- Which pizzas generate the highest and lowest revenue?
- Which pizza categories contribute the most to sales?
- What pizza sizes are most preferred by customers?
- At what time of day are maximum orders placed?
- Which days or periods generate the highest revenue?
- Are there specific pizzas driving most of the revenue?

8. Analytical Approach

The project follows a structured analytical approach:

1. Data understanding and table relationship analysis
2. Data quality checks and cleaning
3. Writing SQL queries ranging from basic KPIs to advanced analytics
4. Generating insights using aggregations, joins, ranking, and time-based analysis
5. Translating query results into business insights and recommendations

9. Key Metrics (KPIs)

The following metrics are used to evaluate business performance:

- Total Revenue
- Total Orders
- Total Pizzas Sold
- Average Order Value
- Revenue by Category
- Revenue by Pizza Size
- Top and Bottom Performing Pizzas

10. Expected Deliverables

- End-to-end SQL project with **25+ business-focused queries**
- Structured insights and storytelling
- Business recommendations
- Final project presentation (PPT) with query screenshots
- Portfolio-ready documentation

11. Success Criteria

The project will be considered successful if:

- Business questions are clearly answered using SQL
- Insights are actionable and business-relevant
- Stakeholders can use findings to improve decision-making
- The project demonstrates strong SQL and analytical skills suitable for a data analyst role
